Thanks to a generous forum member, I've just added the documentation and a disk image of GS BASIC!

I had heard of this software before, but I don't think it was ever released despite being close to completion. Too bad, it seems to be another instance of Apple Computer left us IIgs users hanging in the wind.

It might be buggy/incomplete, but I'd love for some people to try this out and let me know how it goes. It could be a fun way to get more people to develop on the Apple IIgs without going the absolute "hardcore" assembly route.

The files are in the usual places.

Docs: <http://apple2.gs/library.php>

Disk: <http://apple2.gs/compilers.php>

Good luck!
